

## IN THE CLAIMS

Please amend the claims so that they read as follows:

1. (Currently Amended) A light-absorptive antireflection filter ~~allowing light incident from~~ that allows incident light incident on a first surface side ~~of a display section side~~ to pass at a predetermined transmittance and that attenuates ~~attenuating~~ reflected light of the incident light reflected from a second surface side by interference of light at an antireflection multilayer film, said light-absorptive antireflection filter comprising:

a light-absorptive film formed on the first surface side and containing pigment microparticles;

the antireflection multilayer film formed on the second surface side and contacting the light-absorptive film; and

at least one electroconductive thin film included in the antireflection multilayer film.

2. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein a physical thickness of the light-absorptive film is at least about a size of the pigment microparticles and set within a range wherein a quality of the light-absorptive film becomes uniform.

3. (Original) A light-absorptive antireflection filter as set forth in claim 2, wherein the physical thickness of the light-absorptive film is about not less than 10 nm and not more than 1000 nm.

4. (Original) A light-absorptive antireflection filter as set forth in claim 3, wherein the physical thickness of the light-absorptive film is about not less than 100 nm and not more than 800 nm.

5. (Original) A light-absorptive antireflection filter as set forth in claim 2, wherein the physical thickness of the light-absorptive film is at least about a secondary size of aggregates of the pigment microparticles.

6. (Original) A light-absorptive antireflection filter as set forth in claim 3, wherein the light-absorptive film contains microparticles of an organic pigment.

7. (Original) A light-absorptive antireflection filter as set forth in claim 3, wherein the light-absorptive film contains microparticles of an inorganic pigment.

8. (Currently Amended) A light-absorptive antireflection filter as set forth in claim 1, wherein a surface resistance of the electroconductive thin film is about not less than  $50 \Omega/\square$  and not more than  $1000 \Omega/\square$

9. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein the predetermined transmittance is controlled by selecting the type of the pigment microparticles and the ratio of blending it.

10. (Original) A light-absorptive antireflection filter as set forth in claim 9, wherein the predetermined transmittance is about not less than 40 percent and not more than 95 percent with respect to light of a wavelength between 450 nm to 650 nm.

11. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein a reflectance at an interface of the light-absorptive film and the antireflection multilayer film with respect to light incident from the first surface side, defined as a first reflectance, is set within a range wherein reflected light of the light incident from the first surface side at the interface does not form a ghost image visually discernable from the light incident from the first surface side at the first surface.

12. (Original) A light-absorptive antireflection filter as set forth in claim 11, wherein the first reflectance is about not less than 0.1 percent and not more than 10 percent.

13. (Original) A light-absorptive antireflection filter as set forth in claim 12, wherein the first reflectance is not more than about 5 percent.

14. (Original) A light-absorptive antireflection filter as set forth in claim 11, wherein a reflectance at the interface of the light-absorptive film and the antireflection multilayer film with respect to light incident from a second surface side, defined as a second reflectance, is set within a range wherein reflected light of the incident light from the second surface side at the interface substantially does not influence the interference of light at the antireflection multilayer film.

15. (Original) A light-absorptive antireflection filter as set forth in claim 14, wherein the second reflectance is not more than about 1.0 percent.

16. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein the electroconductive thin film contains a transition metal nitride film.

17. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein the electroconductive thin film contains a metal thin film.

18. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein the antireflection multilayer film has a silica film at the outermost layer of the second surface.

19. (Original) A light-absorptive antireflection filter as set forth in claim 18, wherein a refractive index of the silica film is not more than about 1.52 and a physical thickness of the silica film is about 70 to 110 nm.

20. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein the antireflection multilayer film has a magnesium fluoride film at the outermost layer of the second surface.

21. (Original) A light-absorptive antireflection filter as set forth in claim 20, wherein a refractive index of the magnesium fluoride film is not more than about 1.52 and a physical thickness of the magnesium fluoride film is about 70 to 110 nm.

22. (Original) A light-absorptive antireflection filter as set forth in claim 15, wherein a refractive index of the light-absorptive film is about not less than 1.40 and not more than 1.65.

23. (Original) A light-absorptive antireflection filter as set forth in claim 22, wherein the refractive index of the light-absorptive film is about not less than 1.45 and not more than 1.55.

24. (Original) A light-absorptive antireflection filter as set forth in claim 1, wherein the antireflection multilayer film includes a PVD (physical vapor deposition) film.

25. (Original) A light-absorptive antireflection filter as set forth in claim 24, wherein the antireflection multilayer film includes a sputtering film.

26. (Currently Amended) A display device comprising:  
a display unit displaying an image; and  
a light-absorptive antireflection multilayer film formed on the display unit, the light-absorptive antireflection multilayer film allowing light incident ~~from~~ on a first surface side of the display unit side to pass at a predetermined transmittance, and attenuating reflected light of the incident light reflected from a second surface side; ~~the~~ said light-absorptive antireflection multilayer film comprising:

a light-absorptive film formed on the first surface side and containing pigment microparticles,  
an antireflection multilayer film formed on the second surface side and contacting the light-absorptive film, and  
at least one electroconductive thin film included in the antireflection multilayer film.

27. (Original) A display device as set forth in claim 26, wherein a surface of the display unit is substantially flat.

28-31. (Canceled).
